

# AUDIT-OS Partnership Brief

For the call with **Fred Stewart** — Five Rise Consultancy Ltd

PAYING CLIENTS

6 audit firms in Italy

CB COLLABORATION

ESQ CERT — drop this early

STANDARDS SUPPORTED

9 ISO/PAS norms

TIME SAVING

60–80% audit-prep

DATA RESIDENCY

EU (Germany), GDPR

PILOT PRICING

£10–15k / £25–40k / £60k+

# Opening Positioning Statement

"Our system, AUDIT-OS, is an AI-driven engine purpose-built to automate the third-party audit workflow — extracting structured, defensible evidence from a company's documentation and producing the deliverables that certification auditors are required to produce. We've been in production with paying audit firms in Italy for the past audit cycle, and we collaborate operationally with ESQ CERT — an internationally recognised certification body for ISO management systems. We're now exploring controlled expansion into the UK market, which is why this conversation interests us."

**Memorise this.** It establishes: real product, real clients, real CB collaboration, deliberate UK strategy. Duration: 30 seconds.

## SECTION 2

## Who We Are — Credentials

| Item             | What you can say                                                                                                                               |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Status           | Production system, actively used by 6 third-party audit firms in Italy.                                                                        |
| Cycle volume     | Hundreds of real audit cycles across 8 ISO/PAS standards.                                                                                      |
| Documents        | Thousands of documents processed and validated against ISO structure.                                                                          |
| CB Collaboration | ESQ CERT — internationally recognised CB (9001, 14001, 45001, 39001, 37001, SA 8000, EMAS, HACCP). Our outputs are aligned to CB expectations. |
| Tech stack       | Python + JavaScript, production-grade, EU-jurisdiction deployment.                                                                             |
| Maturity         | Multiple iterations on real documents, deterministic behaviour, full audit trail.                                                              |

⚡ **ESQ CERT is the most important name to drop. It signals you are not a side project — you are inside the Italian certification ecosystem.**

## SECTION 3

## What AUDIT-OS Does — Two-Phase Architecture

### Phase 1 — Objective Evidence Extraction

**Input:** ZIP archive with company documentation (risk assessments, contracts, training records, certificates, procedures, technical datasheets, financial documents, supplier files...)

**Output:** DOCX "Objective Evidence Report" organised by ISO clause area (10 macro-categories). Every entry carries *source-file traceability*.

#### FIELDS EXTRACTED PER DOCUMENT

|                      |                         |                   |               |           |                    |
|----------------------|-------------------------|-------------------|---------------|-----------|--------------------|
| Document type        | Title & number          | Date & expiry     | Issuing party | Recipient | Primary ISO clause |
| Secondary categories | Specific extracted data | Traceability link |               |           |                    |

## Phase 2 — Checklist Population

**Input:** Structured JSON from Phase 1 + checklist template for the specific standard.

**Output:** Populated audit checklist (DOCX) with full traceability. The auditor reviews and approves — they don't write from scratch.

### Time saving

*"Our Italian clients report 60–80% reduction in audit-prep time on standard cycles. The actual saving depends on document volume, complexity and prior workflow. We don't promise specific numbers — we run a pilot and measure."*

#### SECTION 4

## What AUDIT-OS Does NOT Do — The Critical Distinction for Fred

Fred runs a **consultancy** (compliance management for the audited company), not an audit firm. This is the most important distinction.

### The comparison in plain English

|                     | Third-party audit (our client)                                | Compliance management (Five Rise domain)               |
|---------------------|---------------------------------------------------------------|--------------------------------------------------------|
| Who does it         | Accredited certification bodies                               | Internal compliance teams, consultants                 |
| Question            | "Does this company meet the standard? Where is the evidence?" | "Where are we falling short? What do we need to fix?"  |
| Output              | Conformity evidence (positive, defensible)                    | Gaps and non-conformities (negative, with remediation) |
| Time horizon        | Periodic (annual / 3-year cycle)                              | Continuous                                             |
| Client relationship | Adversarial-but-fair                                          | Advisory (same team)                                   |

### Capability vs Five Rise Need

| Capability                      | AUDIT-OS today | Five Rise typically needs |
|---------------------------------|----------------|---------------------------|
| Extract evidence from documents | ✔ Yes          | ✔ Yes (overlap)           |
| Classify by ISO clause          | ✔ Yes          | ✔ Yes (overlap)           |
| Populate audit checklist        | ✔ Yes          | ⚠ Partial                 |
| Identify NCRs                   | ✘ Not today    | ✔ Required                |
| Suggest corrective actions      | ✘ Not today    | ✔ Required                |
| Track action plans over time    | ✘ Not today    | ✔ Required                |
| Compliance status dashboard     | ✘ Not today    | ⚠ Often required          |
| Document expiry monitoring      | ✘ Not today    | ✔ Useful                  |

"I want to be clear about something important. Our engine today is optimised for the third-party audit use case — extracting positive evidence to defend an auditor's conclusions. The mirror case — your domain — is compliance management: detecting gaps, tracking remediation, monitoring status over time. The underlying engine is norm-agnostic and could absolutely produce gap reports, NCR-style outputs, and clause-by-clause compliance scores with prompt and schema work — but the continuous workflow layer (action plans, status tracking, renewal alerts) is a separate build. So the question for our partnership is: do you want to licence the engine and build the workflow layer yourself, or do you want us to extend it together towards a full compliance product? Different deals, different timelines."

SECTION 4B

## Compliance Mode — Gap Analysis & NCR

"Beyond the evidence use case, our engine has a **compliance mode** that produces gap analysis and NCR reports instead of positive evidence. The architecture is the same — we process the same documents — but we configure the prompt layer, schema, and output assembly to surface what is missing, inconsistent or non-conformant with the clauses of the relevant ISO standard."

### The technical model — three layers

#### LAYER 1 — CLAUSE COVERAGE MATRIX

For every supported standard, we pre-define the mandatory documentary requirements clause by clause. E.g. ISO 9001: Clause 4.3 → "Scope of the QMS" document required; 5.2 → "Quality Policy"; 6.1 → "Risk assessment"...

⚡ Five Rise's expertise on niche standards (22163, 19443, AS9100-D) is exactly the input to extend this matrix. It's a partnership argument, not a weakness.

#### LAYER 2 — COVERAGE SCORING

| Status         | Meaning                                                                                        |
|----------------|------------------------------------------------------------------------------------------------|
| ✔ Covered      | Relevant document found, content extracted, signatory and date present, within validity period |
| ⚠ Partial      | Document found but missing fields, undated, expired, or weak content match                     |
| ✖ Not covered  | No relevant document in the input set                                                          |
| 🔍 Inconsistent | Multiple documents on the same clause that contradict each other                               |

#### LAYER 3 — NON-CONFORMITY REPORT ASSEMBLY

Output: **Gap Report DOCX** organised by clause area. Each finding has:

| Clause reference                          | Severity                                                 | Gap description              | Cited evidence | Remediation pattern |
|-------------------------------------------|----------------------------------------------------------|------------------------------|----------------|---------------------|
| Severity Model (standard ISO terminology) |                                                          |                              |                |                     |
| Severity                                  | Meaning                                                  | Example                      |                |                     |
| Major NCR                                 | Clause requirement completely unmet, or systemic failure | No Quality Policy documented |                |                     |

| Severity    | Meaning                                     | Example                                                        |
|-------------|---------------------------------------------|----------------------------------------------------------------|
| Minor NCR   | Requirement partially met, isolated lapse   | Quality Policy exists but unsigned/undated                     |
| Observation | Risk indicator, not a non-conformity per se | Policy exists, signed, but >3 years with no evidence of review |

## Remediation Patterns — examples

| Gap                                        | Remediation pattern                                                                                                |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Missing Quality Policy                     | Draft and approve a Quality Policy aligned to clause 5.2; ensure top management sign-off and communication record. |
| Expired training certificates              | Schedule refresher training for affected staff; update training matrix; retain certificates.                       |
| Inconsistent risk assessments across sites | Consolidate risk register; align methodology across sites; document review cycle in QMS manual.                    |

## The pilot deliverable — exact answer when Fred asks "can you do this?"

*"Yes — and I'd treat it as the primary deliverable of the integration pilot. In a £25–40k pilot we can: configure compliance mode for two of your priority standards (9001 + one niche standard), extend the clause coverage matrix using your team's expertise, run the system on two real Five Rise client document sets, deliver a Gap Report DOCX for each client with severity classification, traceability and remediation patterns, and wrap the output into your DMS via API. At the end of 8–12 weeks you have a compliance readiness assessment service you can sell as a productised offering. It's a billable service Five Rise can launch by Q3."*

## If Fred asks "show me a sample gap report"

*"Gap reports for real clients are confidential, and I don't want to mock one up — it would be misleading. What I can do is walk through the structure in a screen-share using a document set we processed for our existing audit clients, and show how the same source documents map into the compliance mode output structure. That gives you a real sense of the output without breaking confidentiality. Want to schedule that for the next call after NDA?"*

### SECTION 5

# Supported Standards

## Supported today

|           |                               |           |                          |
|-----------|-------------------------------|-----------|--------------------------|
| ISO 9001  | Quality Management            | ISO 14001 | Environmental Management |
| ISO 14064 | Greenhouse Gas Quantification | ISO 45001 | Occupational H&S         |
| ISO 27001 | Information Security          | ISO 50001 | Energy Management        |
| ISO 37001 | Anti-bribery                  | ISO 39001 | Road Traffic Safety      |

|           |                          |
|-----------|--------------------------|
| PAS 24000 | Organizational Integrity |
|-----------|--------------------------|

## Five Rise covers, we don't yet

|           |         |
|-----------|---------|
| ISO 22163 | Railway |
|-----------|---------|

|           |         |
|-----------|---------|
| ISO 19443 | Nuclear |
|-----------|---------|

|           |           |
|-----------|-----------|
| AS 9100-D | Aerospace |
|-----------|-----------|

|           |                     |
|-----------|---------------------|
| ISO 22301 | Business Continuity |
|-----------|---------------------|

|           |                  |
|-----------|------------------|
| ISO 55001 | Asset Management |
|-----------|------------------|

"The architecture is norm-agnostic. Adding a standard is approximately 2–4 weeks of prompt engineering and schema mapping per norm, given access to validated checklist templates and real document samples. Your expertise on niche standards — railway, nuclear, aerospace — is exactly the type of asset that makes a partnership with us asymmetrically valuable."

## SECTION 6

# Technical Specs — What You Can Reveal

### Revealable architecture

| Component     | How to describe it                                                        |
|---------------|---------------------------------------------------------------------------|
| Pipeline      | Two-phase: Evidence extraction → Checklist population                     |
| Core engine   | Norm-agnostic with norm-specific prompt and schema layers                 |
| Recovery      | Proprietary multi-level deterministic recovery system                     |
| Deployment    | Containerisable for on-prem or private-cloud                              |
| Integration   | REST API surface for integration with third-party DMS or workflow systems |
| Multi-tenancy | Logical client isolation at application and storage level                 |
| Audit trail   | Every model input/output is logged for forensic traceability              |

### Determinism guarantee

"The system runs with deterministic settings — the same input documents produce equivalent output across runs. This is critical because certification bodies don't accept tools whose output cannot be reproduced under scrutiny."

## ✗ NEVER REVEAL

| DO NOT say                        | Say instead                                                     |
|-----------------------------------|-----------------------------------------------------------------|
| "We use Gemini / Claude / GPT..." | "State-of-the-art LLM, abstracted behind our integration layer" |
| Specific framework names          | "Modern production stack, Python backend, JavaScript frontend"  |

| DO NOT say                     | Say instead                                         |
|--------------------------------|-----------------------------------------------------|
| "We use Hetzner Germany"       | "EU-based hosting in GDPR jurisdiction"             |
| Specific DB names              | "Standard relational database for application data" |
| Prompt content                 | "Prompts are core IP, available under contract"     |
| YAML/JSON schema               | "Schema is shared under contract"                   |
| GitHub repo URL                | Don't reference the repo                            |
| Library names (Pydantic, etc.) | Generic terms only                                  |

Mental model: assume Fred (or Simon Myers) pastes everything you say into an AI tool and asks "rebuild this". Your job is to make sure the description doesn't contain enough information to do that.

SECTION 7

# Security & GDPR

| Aspect           | Statement                                                                                                                  |
|------------------|----------------------------------------------------------------------------------------------------------------------------|
| Data residency   | Production in EU jurisdiction (Germany), under full GDPR jurisdiction. UK-only residency available as a deployment option. |
| Encryption       | TLS 1.2+ end-to-end. HTTPS-only access.                                                                                    |
| Authentication   | Industry-standard credential storage with password hashing.                                                                |
| Multi-tenancy    | Logical isolation per client. No cross-client visibility.                                                                  |
| Audit logs       | Full model input/output audit trail, retention per client policy. Available for client inspection or regulatory request.   |
| DPA              | Standard DPA. DPA in place with all sub-processors.                                                                        |
| Right to erasure | GDPR-compliant. Configurable retention; on request, full purge of client data.                                             |

## Honest weaknesses to acknowledge proactively

| Honest statement                                                                                                                                                                         | Why it's the right move                                                           |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|
| "We are aligned to ISO 27001 controls. Formal certification is on the roadmap, not yet completed."                                                                                       | If you claim the cert and they ask for the certificate number, you're in trouble. |
| "Documents are processed via our LLM sub-processor under DPA. For high-sensitivity engagements, we offer EU-region inference and have validated pathways to private/on-prem deployment." | It's the truth and it's a selling point — most US AI tools can't offer this.      |

## Strong differentiator vs US compliance AI tools

"Most compliance AI tools today are US-based: AuditBoard, MetricStream, Workiva, Sweep. Their data flows hit US infrastructure even when sold in Europe. For your enterprise clients in regulated UK sectors — utilities, government, financial services — that's a non-trivial procurement obstacle. EU residency is baked into us by default, not bolted on after."

# Partnership Model & Pricing

## Non-negotiable: paid pilot first

*"We don't do free integrations. The engineering effort is paid. The shape of any long-term partnership — licence, white-label, revenue share — is defined after a paid pilot, when both sides have real data on what works."*

## Pilot tiers

### DISCOVERY PILOT

**£8k–£15k**

4–6 weeks

UK localisation (English prompts, UKAS terminology), validation on 2–3 representative Five Rise clients on core standards (9001/14001/45001)

### INTEGRATION PILOT ★

**£25k–£40k**

8–12 weeks

Discovery + REST API integration into your DMS + 1 niche standard + per-client dashboard

### CO-DEVELOPMENT

**£60k+**

4–6 months

Everything above + prototype workflow layer (gap detection, NCR generation, action tracking)

## How to introduce pricing — script

*"Pricing depends on what you're trying to do. As a reference: a discovery-level pilot, where we localise the engine for the UK and validate on a few of your clients, typically falls in the £10–15k range over 4–6 weeks. A deeper integration with your existing systems and one of your niche standards is in the £25–40k range over 8–12 weeks. For a co-development engagement extending towards the compliance management use case — gap detection, action tracking — we'd be in the £60k+ range over several months. Which of those resonates with what you have in mind?"*

## Exclusivity, white-label, IP

| Question        | Answer                                                                                                                                                        |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UK exclusivity? | Yes, tied to committed annual revenue minimums. Without minimums, exclusivity blocks our growth without compensating us.                                      |
| White-label?    | Considered long-term after a successful pilot. You brand the front-end, the engine stays ours, royalty per completed audit.                                   |
| IP?             | Core engine remains ours. UK-specific co-developments (localised prompts, DMS adapters) can be jointly owned or exclusively licensed to Five Rise for the UK. |

# Q&A — Functional (A)

## Q1. "What exactly does the system produce?"

Two artefacts. Phase 1: structured Objective Evidence Report (DOCX) — every document in the ZIP transformed into a typed entry with category, ISO clause mapping, date, signatory, source reference. Phase 2: populated audit checklist (DOCX) with every clause linked back to the source evidence.

## Q2. "Walk me through the end-to-end workflow."

The auditor uploads a ZIP archive. The engine extracts text and structured data from every file, classifies each document, maps it to ISO clause structure, validates against the schema with multi-level recovery, and assembles the evidence report. The auditor reviews. Phase 2 takes the validated evidence and produces the populated checklist for the relevant standard.

## Q3. "Is the auditor still in the loop?"

Always. The system is decision-support, not autonomous decision-making. Every output is reviewed and approved by the human auditor. We make their work faster and more consistent — we don't replace their judgment.

## Q4. "How does the system know which ISO clause a document belongs to?"

Through prompt design that encodes the clause structure of each supported standard, plus schema validation that enforces structured output. We've invested significant engineering on this — it's one of the things you'd be licensing.

## Q5. "How fast is it?"

A typical 20-document audit ZIP processes in 2–5 minutes end-to-end. Documents process in parallel batches.

## Q6. "Unusual document formats — handwritten, scanned, foreign language?"

OCR layer for scanned content. Italian documents handled natively. UK localisation is in scope for the pilot. Handwritten content depends on quality — graceful degradation with explicit "n/a" markers where extraction confidence is low.

## Q7. "Contradictory information across documents?"

The system extracts each document's content as-is, with explicit fields. Contradictions surface in the evidence report and the auditor adjudicates. We don't silently resolve contradictions — that would be exactly the black-box behaviour certification bodies reject.

## Q8. "Missing documents — does the system flag them?"

Today, indirectly: missing fields appear as "n/a" in the output. Direct gap detection — "the company did not provide document X required by clause Y" — is a feature we'd build for the compliance use case in the integration or co-development tier.

**Q9A-1. "Can the system identify non-conformities, not just extract evidence?"**

Yes — we run a compliance mode that produces gap analysis and NCR-style findings instead of positive evidence. Same engine, different configuration. We classify findings by severity (Major / Minor / Observation), link each finding to a specific clause, and produce remediation patterns.

**Q9A-2. "Does the gap report cover document expiry dates, renewal dates, currency of evidence?"**

Yes — currency-of-evidence is part of the severity scoring. An unsigned Quality Policy is one severity, a Quality Policy from 2018 with no review record is another. The engine surfaces both.

**Q9A-3. "Can a consultant use the gap report directly with a client, or does it require reworking?"**

Remediation patterns are clause-driven, not company-specific — they give the consultant a structured starting point. The consultant adds the company-specific operational detail and turns the patterns into a real action plan. We provide the structure and the legal reference; you provide the consulting expertise. That's the value division that makes the partnership work.

## Q&A — Technical (B)

**Q9. "Which model are you using?"**

State-of-the-art LLM, abstracted behind our integration layer for swap-ability. We don't lock ourselves to a single vendor — it's an architectural choice for cost, latency, and data residency flexibility.

**Q10. "Is it open-source? Can it run locally?"**

Today we use a hosted LLM under DPA for performance reasons. Architecturally we've validated swappable inference, including private/on-prem deployment for high-sensitivity engagements. Available as a higher-tier deployment option.

**Q11. "What's your tech stack?"**

Standard production-grade stack — Python backend, modern JavaScript frontend, EU-based hosting, containerisable. We can go into specifics under NDA.

**Q12. "How is the system integrated? API? File drop?"**

Both. We have a REST API surface for system-to-system integration and a web UI for direct upload. For your use case — integration into a DMS — the API path is what we'd scope in a pilot.

**Q13. "Can we white-label the front-end?"**

Yes, white-label is one of the long-term arrangements we consider. Details depend on volume and pilot outcome.

**Q14. "How does the recovery system you mentioned work?"**

When the model produces imperfect output, our parser has multiple progressive recovery levels that guarantee we never lose an entire document to a single malformed token. The exact mechanism is proprietary — happy to demonstrate the resilience in a screen-share — but the practical result is pipeline robustness dramatically superior to a naive integration.

**Q15. "How do you handle scale – could it process thousands of documents a day?"**

The architecture is parallel-batch from the ground up. Throughput scales with inference capacity. We can validate scale targets as part of the pilot if you have specific volume requirements.

## Q&A — Security / GDPR (C)

**Q16. "Where is data hosted?"**

EU jurisdiction (Germany), under full GDPR. UK-only residency available as a deployment option for clients who require it.

**Q17. "Encryption?"**

TLS 1.2+ in transit. Platform-level encrypted storage. Specifics in our security documentation, available under NDA.

**Q18. "ISO 27001 certification?"**

Aligned to 27001 controls. Formal certification on the roadmap, not yet completed. Operating under documented security controls and DPIA in the meantime.

**Q19–21. "DPA? Sub-processor list? Data deletion?"**

Standard DPA — we sign DPAs with clients and have DPAs with sub-processors. Full list shared under contract. Right-to-erasure supported — configurable retention; on request, full purge. No training on client data.

## Q&A — Market & Clients (D)

**Q23. "How many clients do you have?"**

Six paying third-party audit firms in Italy, all active with real audit cycles on the platform.

**Q25. "What is your relationship with ESQ CERT?"**

Operational collaboration with an internationally recognised CB. ESQ CERT operates across multiple management system standards (9001, 14001, 45001, 39001, 37001, SA 8000, EMAS, HACCP), and our outputs are aligned to CB expectations through that collaboration.

**Q26. "Why expand into the UK?"**

Mature ISO certification market, English-language launch, strong demand for AI-assisted compliance, strong fit with regulated sectors that require EU-equivalent data handling. Five Rise is interesting for your enterprise client portfolio and your niche standard expertise.

**Q28. "Who are your competitors?"**

The compliance management category — AuditBoard, MetricStream, Sweep, Workiva — all US-based, all focused on the perspective of the audited company rather than the auditor. We don't see a direct overlap in the AI auditor-side category in the EU.

## Q&A — Commercial (E)

**Q29. "What's your pricing model?"**

Today in Italy, per-seat licensing per audit firm. For a partnership with you — licence, reseller, white-label, co-development — the right structure depends on pilot outcome. We start with a paid pilot to discover the right long-term shape.

**Q30. "Why pay for a pilot?"**

Because the pilot is engineering. UK localisation, integration work, validation on your data, schema and prompt work for niche standards. We don't fund client acquisition or integration with our own time — it's not sustainable. The pilot output is yours, the system runs for the pilot clients, and we both have real data to structure the long-term agreement.

**Q9E-1. "If the compliance mode isn't fully built, why pay for a pilot?"**

The engine is built. The compliance mode is configured. What the integration pilot funds is the specific extension to your priority standards, validated on your specific clients' document sets, and integrated into your specific DMS. Without the pilot you'd have a generic tool. With the pilot you have a productised compliance readiness assessment service launchable in Q3. That's the asymmetry.

**Q9E-2. "Could we sell this as a 'compliance readiness assessment' to new clients?"**

Exactly the productised offering the integration pilot delivers — a sellable service for acquiring new clients. It's a strong way to convert prospects: walk into a discovery meeting, run the engine on documents the prospect already has, and present a structured gap report in the second meeting. You demonstrate value before any retainer is signed.

**Q32. "Could we do revenue share?"**

Revenue share after a paid pilot is part of the long-term commercial conversation. Revenue share as a substitute for paid engineering work doesn't work for us.

**Q33. "Can we have UK exclusivity?"**

Tied to committed annual revenue minimums, yes. Without minimums, exclusivity blocks us without protecting us — this is the standard structure.

**Q34. "What does success look like for you in this partnership?"**

Three or four committed UK clients running on the platform within 12 months, with Five Rise as the local sales and onboarding partner. MRR volume that justifies further co-investment in UK-specific extensions.

## Q&A — IP & Continuity (F)

**Q35. "Who owns the IP?"**

Core engine and IP remains ours. UK-specific co-developments — localised prompts, DMS adapters, standard extensions — can be jointly owned or exclusively licensed to Five Rise for the UK territory.

**Q36. "What if you go out of business?"**

Source code escrow with a reputable third party available as part of higher-tier engagements. Standard B2B continuity clause.

**Q37. "What if you get acquired?"**

Existing client licences honour their terms for the full contract duration. Standard change-of-control protection in our contracts.

**Q38. "Can we see the source code?"**

Not under standard licensing. Available under deeper engagement terms with escrow.

## Q&A — Roadmap & Team (G)

**Q39. "Who would we be working with day-to-day?"**

I'm the technical lead. For a pilot you'd interact with me directly plus a project coordinator. The pilot kickoff includes a workshop with you, your tech lead and 1–2 representative clients.

**Q40. "What's your 12-month roadmap?"**

Standard coverage expansion, EU-English localisation (this UK conversation is part of that), enterprise features including DPIA support, ISO 27001 certification, and on-prem deployment for high-sensitivity clients.

# Deflection Scripts

| Probe                                 | Deflection                                                                                                                                |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| "Which specific AI model exactly?"    | "State-of-the-art LLM, abstracted behind our integration layer. The model is a component; the value is the engineering around it."        |
| "Can you share a prompt example?"     | "Prompts are core IP. Available under contract, not just under NDA."                                                                      |
| "Can you send me the schema?"         | "The schema is shared under contract — 12 months of iteration is in there."                                                               |
| "Could I see the source code?"        | "Source access is part of higher-tier engagements with escrow. Not standard licensing."                                                   |
| "Send me a sample report by email."   | "I'd rather show you in a live screen-share, on a real anonymised case. Avoids any IP leak from emailed material."                        |
| "How exactly does the recovery work?" | "Multi-level fallback logic. The mechanism is proprietary engineering — that's the moat. Happy to demonstrate the result in a live demo." |
| "What libraries are you using?"       | "Standard production stack. Specifics covered under technical NDA."                                                                       |
| "How large is your codebase?"         | "Large enough. It's not the right metric for what you're trying to assess."                                                               |

## Universal redirect when in doubt

"I'd rather show you what it solves for your specific clients than how it's built — the 'how' matters less than the 'so what' at this stage. Tell me about a recent client engagement where document comprehension was the bottleneck, and let me show you how we'd handle it."

### SECTION 11

## Questions You MUST Ask Fred

Don't leave the call without answers to these.

|   |                                                                                                                                                       |                                            |
|---|-------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------|
| 1 | "What does your broader solution look like today — built, MVP, or still architectural?"                                                               | (reveals their actual phase)               |
| 2 | "Of your 140+ clients, how many are active retainers? What's the typical annual spend?"                                                               | (reveals their real distribution leverage) |
| 3 | "Your enterprise clients — UK Gov, Coca-Cola, United Utilities — what compliance tech stack do they have today, and what gap are you trying to fill?" | (reveals the real demand)                  |
| 4 | "Who drives the vendor technical evaluation on your side? At what point do we bring in Simon Myers?"                                                  | (reveals decision authority)               |
| 5 | "If we ran a £15–20k pilot in the next 8 weeks with two of your clients, what would success look like for Five Rise — concretely?"                    | (forces the commitment)                    |

### SECTION 12

# Three Things to Leave in Fred's Head

GOAL: WHEN THE CALL ENDS, FRED REMEMBERS THESE THREE THINGS.

- 1 "These are not a side project — they have paying audit firms in Italy and collaborate with ESQ CERT."
- 2 "Their engine is auditor-side; for our compliance management use case they need extensions, but the underlying tech is real and the path to a full compliance product is months, not years."
- 3 "They want a paid pilot. They won't give us free engineering. We need to be ready to spend £15–40k to find out if it works."

## SECTION 13

### Pre-Call Checklist

- ☐ One-pager open: 8 standards, 6 clients, ESQ CERT, 2-phase pipeline, EU residency, deterministic, multi-level recovery, audit-grade traceability
- ☐ Anonymised screenshot of a DOCX evidence report (for screen-share, NEVER by email)
- ☐ Five Rise niche standard list ready (22163, 19443, AS9100-D, 22301, 55001)
- ☐ NDA template ready to send post-call if the conversation goes well
- ☐ Mental note: never name the LLM, never describe the recovery algorithm, never describe the schema
- ☐ Pricing ranges memorised: £10–15k / £25–40k / £60k+
- ☐ The 5 questions for Fred (Section 11) on screen
- ☐ Time check on the 45-min slot — leave 10 min for "next steps"

## SECTION 14

### How to Close the Call

*"Look — I think there's a real shape here. The natural next steps are: I send a mutual NDA today, we book a deeper technical session within two weeks (with Simon and your tech lead), and based on that I scope a concrete pilot proposal in writing. Does that work for you?"*

## Three clear steps to propose

| Step | Timing                 | Action                                                              |
|------|------------------------|---------------------------------------------------------------------|
| 1    | Today                  | Send mutual NDA                                                     |
| 2    | Within 2 weeks         | Deeper technical session (with Simon Myers and Five Rise tech lead) |
| 3    | Post-technical session | Concrete pilot proposal in written form                             |
